

To VDR Makers and their representatives

Tjodalyng: June.2019

IMPORTANT NOTIFICATION, Tron 40VDR Capsule and new C/S Tac.no

Due to Cospas-Sarsat's (C/S) limitation in individual allocated serial.no on C/S approved Beacon Models with GPS, Jotron's Tron 40 VDR Float Free Capsule has been assigned with a new Tac.no. The current version of the Tron 40VDR has used C/S Tac.no 185, but from serial.no 16385, each Tron 40VDR will be programmed with C/S tac.no 318. Jotron expects to start producing 40VDR with Tac.no 318 in the start of Aug.2019.

It is important to notice the following;

Anyone who is set to program a Tron 40VDR with serial.no 16385 and above must make sure to use the latest version of the Jotron programming Software (SW) Tron Link EPIRB. The valid programming SW is version 4.1.0 and will be sent to the VDR maker who has approved the use of Tron 40VDR into their VDR system, in addition, the Tron Link EPIRB SW will be available from our web under "Log-in".

It is also important to notice that the old programming SW type PR40 does not include the Tac.no 318 and can therefore not be used for programming Tron 40VDR with serial.no 16385 and above.

Jotron encourages all VDR makers who use the Tron 40VDR Float Free Capsule to distribute this letter and information within their own organization. In addition, please distribute this info to your own dealers/partners so to make sure any preparation concerning the above mentioned change of Tac.no and the use of correct programming SW.

Should you have any questions related to the information given in this letter, please contact Jotron support-Dept, support@jotron.com
